Fact and dimension identification

Phase 1 design deliverable v2 | 10 November 2026

Purpose

The canonical model must separate logical outputs from source records and time-varying observations. The old publication mart remains a downstream analytical mart.

Requirements / design

Dimensions: date, output type, topic, person/creator, institution, venue/repository, access status, funder. Relationships/bridges: output-topic, output-creator, output-institution, output-funder and typed output-to-output relationships. Facts: publication/output activity, periodic output observation, directed citation/relationship fact; optional derived topic-intersection mart.

Scope and caveats

Source records are not canonical outputs. Overlapping Crossref/OpenAlex/DataCite/Zenodo records must be crosswalked, not simply added.

Source and architecture references

See docs/sources.md, docs/architecture/README.md, docs/requirements/incremental-ingestion-design.md, docs/requirements/course-requirements-matrix.md, and the target architecture diagram. Phase 2 and Phase 3 implementation has not started.
